Neuropsychology Of Childhood Epilepsy (Advances In Behavioral Biology)

Synopsis

This book is devoted to the neuropsychological description of childhood epilepsy, a neurological condition that constitutes one of the most prevalent forms of chronic and disabling childhood illnesses. Indeed, one child out of 20 experiences one or more seizures before the age of 5, and one in a hundred develops epilepsy as a chronic disorder. Approximately half of these children with epilepsy display academic difficulties and/or behavioral disorders. Moreover, it is now believed that a sizable proportion of children with learning disability suffer from undiagnosed epilepsy. While a great number of textbooks have been devoted to various medical aspects of childhood epilepsy (diagnosis, genetics, etiology, drug and surgical treatment, etc.), there have been no comprehensive accounts of the cognitive consequences of this condition. Advance of medical knowledge has shown that childhood epilepsy should not be considered as a single disorder but encompasses a whole range of different conditions that exhibit specific clinical EEG and outcome characteristics. It is not becoming apparent that these various clinical entities have different cognitive expression that yet need to be specified. The purpose of this book is to provide a complete up-to-date analysis of this multi-faceted pathology.

Customer Reviews

The content of this book seems excellent, but I am quite dissatisfied with the actual book. The binding is poor. I was reading the book for less than 15 minutes before one of the pages fell out.

Moreover, the printing is poor. The book features lots of images, mostly MRI. The printing is of such low quality that these can hardly be seen. They are too dark and appear as black blotches.
